this document consists of three sections each with its own table of contents and independent numbering part i operational analysis of collector distributor systems develops a procedure for capacity analysis of collector distributor c d roads between successive interchanges the description of the capacity analysis procedure generally follows the 1985 highway capacity manual procedures however a new procedure developed in july 1990 at the university of california berkeley is used for the weaving sections there is a completed example of the entire procedure for the existing roe nall and the once proposed braided ramp systems on i 435 in johnson county kansas this study also identified problems at the merge diverge areas of the system as a result of

the concentration of two freeway diverging flows at one off ramp junction and the accumulation of two c d merging flows at one on ramp junction configuration changes such as the addition of an auxiliary lane at the merge location and a second off ramp between the interchanges for the diverge area were also analyzed for comparative purposes part ii operational analysis of the full cloverleaf interchange equipped with collector distributor roads describes the advantages of the c d interchange a methodology to analyze the interchange and some of the problems associated with the analysis the study demonstrates the analysis procedure and reveals that the merge and diverge points become problem areas of the interchange when c d roads are added therefore the improvements made by moving the weaving area off the mainline should be compared to the decreased level of service at the merge diverge areas the study recommends auxiliary lanes for both the merge and diverge areas when c d interchanges are being considered part iii is the technical appendix for part ii
